

Anti-Mouse Ly-49G2 FITC

Catalog Number: 11-5781

Also Known As: LGL-1, Ly49G2

RUO: For Research Use Only

Staining of C57BL/6 splenocytes with Anti-Mouse CD49b (Integrin $\alpha 2$) PE (cat. 12-5971) and 0.125 μ g of Rat IgG2a κ Isotype Control FITC (cat. 11-4321) (left) or 0.125 μ g of Anti-Mouse Ly-49G2 FITC (right). Total viable cells were used for analysis.

Product Information

Contents: Anti-Mouse Ly-49G2 FITC

REF Catalog Number: 11-5781

Clone: eBio4D11 (4D11)

Concentration: 0.5 mg/ml

Host/Isotype: Rat IgG2a, κ

Formulation: aqueous buffer, 0.09% sodium azide, may contain carrier protein/stabilizer

Temperature Limitation: Store at 2-8°C. Do not freeze. Light sensitive material.

Batch Code: Refer to Vial

Use By: Refer to Vial

Caution, contains Azide

Description

The 4D11 monoclonal antibody reacts with Ly-49G2 (also known as LGL-1). The Ly-49 family of NK-cell receptors, members of the C-type lectin superfamily, are disulfide-linked type-II transmembrane protein homodimers with extracellular carbohydrate recognition domains, which bind to MHC class I alloantigens. The Ly-49 family members are expressed independently, such that an individual NK or T cell may display more than one class of Ly-49 receptor. Ly-49G2 is an inhibitory receptor expressed on subsets of natural killer (NK) cells, NK-T cells (in all strains tested), and on a population of memory CD8+ T cells (in C57BL/6 mice). The 4D11 antibody has been reported to cross react with the Ly-49AB6, Ly-49ABALB, and Ly-49T129/J inhibitory receptors and Ly-49LCBA/J activating receptors. The proportion of NK-T cells expressing Ly-49A and Ly-49G2 is higher in the thymus than in liver, and there is evidence that down-regulation of Ly-49 receptor expression is necessary for normal NK-T-cell development to occur.

Applications Reported

This eBio4D11 (4D11) antibody has been reported for use in flow cytometric analysis.

Applications Tested

This eBio4D11 (4D11) antibody has been tested by flow cytometric analysis of mouse splenocytes. This can be used at less than or equal to 0.25 μ g per test. A test is defined as the amount (μ g) of antibody that will stain a cell sample in a final volume of 100 μ L. Cell number should be determined empirically but can range from 10^5 to 10^8 cells/test. It is recommended that the antibody be carefully titrated for optimal performance in the assay of interest.
